SI Table 1. The trophic level [mean ± SD] of each oyster reef-associated consumers and the proportional contribution [median (lower 95% CI, upper 95% CI)] of each basal resource to consumers for each estuary sampled. White shrimp were not collected in NC and therefore not included for that estuary.

SI Table 2. Trophic niche size and Sørensen overlap index (proportional values range between 0-1) output from hypervolume analysis for all consumers (blue crabs, mud crabs, oysters, pinfish, and white shrimp) sampled across four estuaries in the SAB. White shrimp were not collected in NC and therefore not included for that estuary.
